Audiometer and Spirometer Integration Featured in New Video

MINNEAPOLIS, MN (August 3, 2015) Close to twenty percent of U.S. occupational health programs conduct both hearing and pulmonary function tests. When programs encompass hundreds—or even thousands—of employees, keeping the audiogram and spirogram data connected to individual employee records can be a complex, administration-intensive task. A new video, “Audiometer and Spirometer Integration,” provides occupational health professionals with insight into how test data can be stored and shared between audiometers and spirometers, which in turn simplifies the process and consolidates both audiograms and spirograms into one employee record.

The integration of the Benson Medical Instruments CCA-200*mini* Plus audiometer and the CCS-200 Plus spirometer gives occupational health program managers the ability to run the database software on the same PC, run the devices separately or integrated, or run both separately on different PCs. For instance, the video shows how changes made to an employee record in the audiometer database will also appear updated in the spirometer database, eliminating the need to enter and modify the data twice and reducing the potential for errors.

Furthermore, occupational health nurses and practitioners who learn to run the CCA-200*mini* Plus will quickly know how to run the CCS-200 Plus, and vice versa.

“The integrated database of the CCA-200*mini* Plus and CCS-200 Plus helps occupational health and safety practitioners meet OSHA recordkeeping requirements,” states David Mayou, Sales Manager of Benson Medical Instruments. “It also allows data to be shared on networked computers between one corporate location and another, or between the corporate office and the consulting audiologist and pulmonologist.”

Benson Medical Instruments Co. designs and manufactures audiometers, spirometers, and software to manage hearing conservation and occupational spirometry programs for companies.
