Is Your Hearing Conservation Software Network-Compatible?

MINNEAPOLIS MN (December 11, 2012) – Audiometers that are network database compatible are increasingly the audiometer of choice for large organizations with multiple locations and multi-user data sharing requirements. Benson Medical Instruments' CCA-200*mini* Plus, which seamlessly integrates audiometric testing with database functionality, offers network database compatibility using the industry standard Microsoft® SQL Server 2008 platform.

The benefit of having data on your company server offers three distinct advantages: 1) multi-user data sharing capabilities; 2) automatic, convenient, and routine data backups; and 3) the physical security of having data server-based as opposed to spread out on multiple (non-networked) computers. In the last two situations, even a single-office company would enjoy the benefits of network database compatibility.

“We are seeing more and more large, multi-office organizations move toward audiometers that offer network database compatibility,” David Mayou, Sales Manager for Benson Medical Instruments, states directly. “When you have several offices, each with many people who need to access the same data simultaneously, network database compatibility moves from the “want”

to “need” category very quickly. If you do not have an audiometer that can handle this requirement, you wind up desperately wanting one that does.”

Benson Medical Instruments Co. designs and manufactures audiometers, spirometers, and software to manage hearing conservation and occupational spirometry programs for companies.
