Reviewing Recordable Hearing Loss the Easy Way

MINNEAPOLIS, MN (September 25, 2012) – When the clock is ticking to list recordable hearing loss in the OSHA 300 log, supervising professionals need to determine whose standard threshold shifts (STS's) are work-related and whose aren't. Saving precious time for professionals without sacrificing accuracy is what the innovators at Benson Medical Instruments do best.

Benson Medical Instruments CCA-200*mini* audiometer shown with the BAS-200 bio-acoustic simulator sound level meter

Benson Medical Instruments has a host of outstanding hearing conservation solutions, most notably the popular CCA-200*mini* Plus audiometer that identifies STS's and possible recordable entries. A powerful Professional Review feature in the software presents the reviewing physician or audiologist with a list of these potential recordables and displays each person's past audiograms with relevant calculations.

After the audiologist or physician makes a determination on work-relatedness, it's as simple as the click of a button to add results to the audiometric history. To round out the package, the CCA-200*mini* Plus is equipped with a complete set of reports, including lists of employees found

to have work-related hearing loss; those whose hearing loss is not work-related and those who need to be retested.

“It’s fantastic,” says Dr. Richard Vaughn, an audiologist for HealthMetrics, an occupational health services provider in Fresno, CA. “I can identify and review recordables very quickly. You can click on the baseline and walk right through year by year to review the audiometric history up to [the] current [results]. I was spending an exorbitant amount of time on these reviews and Benson Medical’s software sped it up!”

Benson Medical Instruments Co. designs and manufactures audiometers, spirometers, and software to manage hearing conservation and occupational spirometry programs for companies.
